## Chapter 28: Lipids In a slightly different order than in your textbook

## **Fatty Acids**

common name	shorthand notations #of C : # of C=C #of C, location of C=C	line structure	comments
butyric acid	4:0	ОН	in butterfat
lauric acid	12:0	ОН	in coconut oil
myristic acid	14:0	он ОН	in nutmeg oil
palmitic acid	16:0	ОН	in palm oil
palmitoleic acid	$16:1 \ C_{16}\Delta^9$	ОН	in oils and fats
stearic acid	18:0	~~~~~	beef tallow and human fat
oleic acid	$18:1\\ \mathrm{C}_{18}\Delta^9$	ОН	olive oil, lard, and human fat
linoleic acid	$18:2 \\ C_{18}\Delta^{9,12}$	ОН	in many vegetable oils and linseed oil

α-linolenic acid	$18:3$ $C_{18}\Delta^{9,12,15}$	ОН	the $\gamma$ - isomer $\Delta^{6,9,12}$ is not as essential	
arachidonic acid	$C_{20}\Delta^{5,8,11,14}$	ОН	precursor to prostaglandins, prostacyclins, and thromboxanes	
eicosapentaenoic acid [EPA]	$\begin{array}{c} \textbf{20:5} \\ \textbf{C}_{20} \boldsymbol{\Delta}^{5,8,11,14,17} \end{array}$	try drawing it! all the C=C are cis	an (\omega-3) fatty acid	
docosahexaenoic acid [DHA]	$\begin{array}{c} 22:6 \\ C_{22}\Delta^{4,7,10,13,16,19} \end{array}$	try drawing it! all the C=C are cis	an (ω-3) fatty acid	
		Waxes		
beeswax	is actually a mixture of fatty esters and hydrocarbons. see below for a typical component, where the acid and the alcohol both have 26 carbons; the length of the fatty acid can range from 18? to 36 C and the alcohol from 24 to 36 C		a most useful material! [to us as well as to bees]	
~~~	~~~~\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\			
	GI	ycerolipids		
class				
triglyceride	R2´	$\bigcap_{O} \bigcap_{R1} \bigcap_{O} R3$	if solid, it's called a fat; if liquid, an oil. Melting point depends on chain length and degree of unsaturation.	
diglyceride	ŀ	R1 $O$ $R3$	formed during fat digestion and used as food additive [emulsifier]	

monoglyceride	R2 OHOH	formed during fat digestion and used as food additive [emulsifier]
phosphatidic acid	$\begin{array}{c} O \\ R1 \\ O \\ O \\ O \\ O \\ O \end{array}$	building block of glycerophospholipids
lecithin phosphatidyl choline	$\begin{array}{c} O \\ O \\ O \\ O \\ O \\ O \end{array}$	a key cell membrane component
cephalin phosphatidyl ethanolamine	R2 O R1  O R1  O P <sup>+</sup> -O NH <sub>3</sub> +	another common cell membrane component
cephalin phosphatidyl serine	R2 O R1  O R1  O P+O- O NH <sub>3</sub> + O-O O	another common cell membrane component

phosphatidyl inositol	R2 O R1  O R1  O O O O O O O O O O O O O O O O O O O	a less-common membrane component
	Sphingolipids	
sphingosine	$H_3C$ $H_3C$ $H_4$ $H_5$ $H_4$ $H_5$ $H_4$ $H_5$ $H_4$ $H_5$ $H_5$ $H_6$ $H_7$ $H_8$	the basic building block of sphingolipids, ~ never found free
ceramide N-acyl sphingosine	H <sub>3</sub> C OH NH OH OH	the usual form from which sphingolipids are assembled
sphingomyelin	H <sub>3</sub> C CH <sub>3</sub> H <sub>3</sub> C CH <sub>3</sub> H <sub>4</sub> C NH  H OH  H <sub>5</sub> C  H <sub>7</sub> C CH <sub>5</sub> H OH  N T CH <sub>3</sub> H OH  N T CH  N T	the only phosphorus- containing class of sphingolipids
cerebroside	H <sub>2</sub> C HO HO HO OH	sugar is usually gal, can be glc
ganglioside	Really, really big	variable branched oligosaccharides

	Steroids		
sterane	A B		
cholesterol	$H_3^{21}$ $CH_3^{20}$ $CH_3^$		
sodium taurocholate	OH $OH$ $OH$ $OH$ $OH$ $OH$ $OH$ $OH$	a "bile salt" sysnthesized in the liver from cholesterol and used to emulsify fat during digestion.	
cortisol	HO CH <sub>3</sub> IIOH	elevates blood glucose levels, promotes breakdown of muscle protein and subsequent catabolism of amino acids; antiinflammatory, suppresses immune system activity.	

		<del> </del>
cortisone	CH <sub>3</sub> CH <sub>3</sub> CH <sub>3</sub> CH <sub>3</sub> CH <sub>3</sub> CH <sub>3</sub>	semisynthetic antiinflammatory agent
prednisolone	HO CH <sub>3</sub> WIIOH	a synthetic antiinflammatory steroid
aldosterone	HO CH <sub>3</sub>	the main mineralocorticoid; promotes sodium reabsorption and potassium excretion in the kidneys
testosterone	CH <sub>3</sub> OH	the major androgen; increases muscle mass and induces male secondary sexual characteristics

androstenedione		alleged to be a human pheromone, it's also the stuff Mark McGwire used [baseball's drug policies are a lot laxer than those of other sports]
Dianabol	CH <sub>3</sub> OH CH <sub>3</sub>	the most popular synthetic anabolic steroid; widely abused, produces "roid rage" has been said to cause liver cancer
β-estradiol	HO CH <sub>3</sub> OH	the major estrogen; prevents osteoporosis and may help protect against cardiovascular conditions.
diethylstilbestrol	HO CH <sub>3</sub> H <sub>3</sub> C OH	synthetic compound with estrogen activity; caused cervical cancer in the daughters of women who took it as a fertility agent in the '50s and '60s; used to fatten beef cattle.
progesterone	CH <sub>3</sub> CH <sub>3</sub> CH <sub>3</sub>	the main progestin; prepares uterine lining for implantation

## **Eicosanoids:** Prostaglandins, Prostacyclins, Thromboxanes, Leukotrienes the precursor to the 1- and 2arachidonic acid series; EPA is the precursor to the 3series has tissue-specific effects on smooth PGE<sub>2</sub> muscle .CH<sub>3</sub> HO HO has tissue-specific effects on smooth muscle; E and F $PGF_{2\alpha}$ types usually HO mutually antagonistic HÒ prostacyclins are produced by cells in the linings of $PGI_2$ blood vessels and prostacyclin antagonize thromboxane $CH_3$ activity Ē OH thromboxanes are produced by $TXA_2$ activated blood thromboxane platelets and HÔ activate other CH<sub>3</sub> platelets

LTA <sub>4</sub> leukotriene A4	C OH	
LTB <sub>4</sub> leukotriene B4	OH OH OH COH	
LTC <sub>4</sub> leukotriene C4, a.k.a. SRS-A	O CON OH	the "slow-reacting substance of anaphylaxis"
